foresea

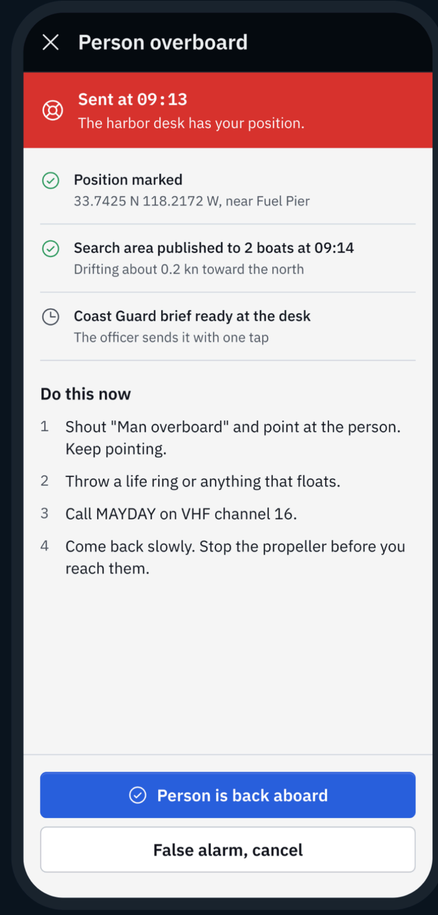

InnovateLA Dual-Use Hackathon
Marine track with NULL Systems

See it coming.
Keep the port open.

Foresea predicts where an unknown underwater drone is going and moves only the boats in its path, so the harbor never has to shut down.

Identify

Size, heat, speed and an ID ping tell a drone apart from a whale, a lost robot or a person.

Predict

Our model TELL reads every move and draws a hurricane style forecast of where it is headed.

Give way

Only the boats in its path get a new route, priced in minutes. Nothing closes.

A person decides

The officer publishes in one tap. Captains get one clear instruction in seconds.

One engine. Every day.

The same math that tracks a hostile drone runs the harbor on a normal Tuesday, with live AIS, NOAA and weather data.

- Divers in the water
- Lost robot search
- Live tide and weather
- Whale slow zones
- Person overboard SOS
- Real ship arrival times

74 min
of warning, 1.56x the nearest dock guess

97%
of drone paths stay inside the forecast

0
gates closed. Only boats in the path move

Try it live
foresea.imdusty.com
Scan it, then drive the drone yourself.
